

DBpedia into Neo4j

Big Data Technologies Course

a.a. 2016/2017

Federico Bianchi, Marco Cremaschi, Alessandro Gabrielli

Main Goals of the Project

— — —

- Import DBpedia into Neo4j
- Evaluate the performance of Neo4j
- Comparison of performance between Neo4j and Virtuoso

Process

— — —

1. Re-elaboration of the DBpedia structure
 - a. Download DBpedia
 - b. Using a Scala script to convert DBpedia
 - c. Create a CSV
2. Importation of DBpedia into Neo4j
3. Creation of a cluster
4. Installation of Neo4j in the cluster
5. Performance evaluation

DBpedia is the structured representation of Wikipedia

Barack Obama

Personal details

Born Barack Hussein Obama II
August 4, 1961 (age 55)
[Honolulu, Hawaii, U.S.](#)

Political party [Democratic](#)

Spouse(s) [Michelle Robinson](#) ([m. 1992](#))

Triple Structure: Subject - Predicate - Object

Neo4j

— — —

Neo4j is an industrial scale graph database:

1. Fast for traversal queries
2. Provides REST APIs
3. Simple query language

Is it **possible to import** DBpedia data into Neo4j?

1. Re-elaboration of the DBpedia structure

Step 1: Server specifications

— — —

Neo4j 3.1.3
Hadoop 2.7.3
SBT 0.13.15
Scala 2.10.6

Step 1a: Download DBpedia

— — —

FILE: DBpedia URI mapped to Wikipedia URI - wikipedia_links_en.nt

HEADER: DBPEDIA_RESOURCE_URI, RDF_TYPE, WIKIPEDIA_PAGE_URI

```
<http://dbpedia.org/resource/AccessibleComputing> <http://xmlns.com/foaf/0.1/isPrimaryTopicOf>  
<http://en.wikipedia.org/wiki/AccessibleComputing> .
```

FILE: Wikipedia page link - page_links_en.nt

HEADER: DBPEDIA_RESOURCE_SRC, RDF_TYPE, DBPEDIA_RESOURCE_DST

```
<http://dbpedia.org/resource/AccessibleComputing> <http://dbpedia.org/ontology/wikiPageWikiLink>  
<http://dbpedia.org/resource/Computer_accessibility> .
```

FILE: Page titles mapped to DBpedia URI - labels_en.nt

HEADER: DBPEDIA_RESOURCE_URI, RDF_TYPE, PAGE_NAME

```
<http://dbpedia.org/resource/AccessibleComputing> <http://www.w3.org/2000/01/rdf-schema#label> "AccessibleComputing"@en .
```

Step 1a: Download DBpedia

— — —

FILE: DBpedia categories mapped to pages - article_categories_en.nt

HEADER: DBPEDIA_RESOURCE_URI, RDF_TYPE, DBPEDIA_CATEGORY_URI

<http://dbpedia.org/resource/Albedo> <http://purl.org/dc/terms/subject> <http://dbpedia.org/resource/Category:Climate_forcing> .

FILE: DBpedia ontology mapped to pages - instance_types_en.nt

HEADER: DBPEDIA_RESOURCE_URI, RDF_TYPE, DBPEDIA_ONTOLOGY_URI

<http://dbpedia.org/resource/Autism> <http://www.w3.org/1999/02/22-rdf-syntax-ns#type> <http://dbpedia.org/ontology/Disease> .

Step 1a: Scala script workflow

— — —

Since Neo4j can import files with a CSV extension, we had to convert the DBpedia datasets. In order to convert the dataset and create the CSV file, we used a Scala script (<https://github.com/kbastani/neo4j-dbpedia-importer>)

The script uses Spark to process files and Hadoop to save them

Step 1**b**: Scala script workflow

— — —

1 Import the page nodes and link graph

1. First stage: Join the Wikipedia map file and the names map file into a single RDD
 - a. Extract Wikipedia links from wikipedia_links_en.nt
 - b. Extract Pages name from page_links_en.nt
 - c. Join Wikipedia links and Pages name
 - d. Take the union of the two datasets and generate a CSV
2. Second stage: Encode each value in the page links file with the unique node id generated during the last stage
 - a. Create an in-memory hash table to lookup DBpedia keys and return the encoded unique node id
 - b. Process page links saved in page_links_en.nt
3. Final stage: Save the page nodes and relationship results to HDFS

Step 1**b**: Scala script workflow

— — —

2 Import the category nodes

1. Extract categories from `article_categories_en.nt`
 - a. Get a distinct list of categories and generate a node index
 - b. Save the category list to HDFS

Step 1**b**: Scala script workflow

— — —

3 Import the ontology graph

1. Extract ontology types from `Instance_types_en.nt`
 - a. Get a distinct list of ontology and generate a node index
 - b. Save the ontology list to HDFS

Step 1b: Output

— — —

HDFS dir: /pagenodes

HEADER: dbpedia, id, l:label, wikipedia, title

EXAMPLE: http://dbpedia.org/resource/Guy_C._Swan 177 Page http://en.wikipedia.org/wiki/Guy_C._Swan Guy C. Swan

HDFS dir: /pagerels

HEADER: start, end, type

EXAMPLE: 2803179 9838885 HAS_LINK

HDFS dir: /categorynodes

HEADER: dbpedia, id, l:label

EXAMPLE: 10995010 Category http://dbpedia.org/resource/Category:Corruption_in_Chile Corruption in Chile

HDFS dir: /categoryrels

HEADER: start, end, type

EXAMPLE: 10994968 11144781 HAS_CATEGORY

HDFS dir: /ontologynodes

HEADER: dbpedia, id, l:label, wikipedia, title

EXAMPLE: 11855115 Ontology <http://schema.org/Book> Book

HDFS dir: /ontologyrels

HEADER: start, end, type

EXAMPLE: 11855053 8324598 HAS_ONTOLOGY

Step 1c: Create a CSV

— — —

File name: page_nodes.csv

Command: `bin/hadoop fs -cat "/pagenodes/part-" | bin/hadoop fs -put - /page_nodes.csv`

File name: page_rels.csv

Command: `bin/hadoop fs -cat "/pagerels/part-" | bin/hadoop fs -put - /page_rels.csv`

File name: category_nodes.csv

Command: `bin/hadoop fs -cat "/categorynodes/part-" | bin/hadoop fs -put - /category_nodes.csv`

File name: category_rels.csv

Command: `bin/hadoop fs -cat "/categoryrels/part-" | bin/hadoop fs -put - /category_rels.csv`

File name: ontology_nodes.csv

Command: `bin/hadoop fs -cat "/ontologynodes/part-" | bin/hadoop fs -put - /ontology_nodes.csv`

File name: ontology_rels.csv

Command: `bin/hadoop fs -cat "/ontologyrels/part-" | bin/hadoop fs -put - /ontology_rels.csv`

2. Import of DBpedia into Neo4j

Step 2: Import DBpedia (first try)

— — —

```
USING PERIODIC COMMIT
LOAD CSV WITH HEADERS FROM 'file:///ontology_nodes.csv' AS line
FIELDTERMINATOR '\t'
CREATE (:Ontology { ontologyId: line.id, label: line.label, dbpedia: line.dbpedia, title: line.title})
```

```
USING PERIODIC COMMIT
LOAD CSV WITH HEADERS FROM 'file:///category_nodes.csv' AS line
FIELDTERMINATOR '\t'
CREATE (:Category { ontologyId: line.id, label: line.label, dbpedia: line.dbpedia, title: line.title})
```

```
USING PERIODIC COMMIT
LOAD CSV WITH HEADERS FROM 'file:///page_nodes.csv' AS line
FIELDTERMINATOR '\t'
CREATE (:Page { ontologyId: line.id, label: line.label, dbpedia: line.dbpedia, title: line.title})
```

```
CREATE INDEX ON :Ontology(ontologyId)
```

...

TOT: 6h!

Step 2: Import DBpedia (first try)

— — —

```
USING PERIODIC COMMIT
LOAD CSV WITH HEADERS FROM 'file:///ontology_rels.csv' AS line
FIELDTERMINATOR '\t'
MATCH (s:Ontology {ontologyId: line.start}), (e:Page {pageId: line.end})
CREATE (s)-[:HAS_ONTOLOGY]->(e);
```

TOT: 6h!

Step 2: Import DBpedia (second try)

— — —

```
neo4j-import --into dbpedia.db --delimiter '\t' --id-type string \  
--nodes:Ontology ontology_nodes_test.csv \  
--nodes:Category category_nodes_test.csv \  
--nodes:Page page_nodes_test.csv \  
--relationships:HAS_ONTOLLOGY ontology_rels_test.csv \  
--relationships:HAS_CATEGORY category_rels_test.csv \  
--relationships:HAS_LINK page_rels_test.csv
```

**TOT: 15
minutes!**

Step 2: Import DBpedia using Neo4J Command line

— — —

FILE: ontology_nodes.csv

HEADER - **ontologyId:ID(Ontology)**, label, dbpedia, title

FILE: category_nodes.csv

HEADER - **categoryId:ID(Category)**, label, dbpedia, title

FILE: pages_nodes.csv

HEADER - **pageId:ID(Page)**, label, wikipedia, title

FILE: ontology_rels.csv

HEADER - **:START_ID(Ontology)**, **:END_ID(Page)**, type:IGNORE

FILE: category_rels.csv

HEADER - **:START_ID(Category)**, **:END_ID(Category)**, type:IGNORE

HEADER - **:START_ID(Category)**, **:END_ID(Page)**, type:IGNORE

FILE: page_rels.csv

HEADER - **:START_ID(Page)**, **:END_ID(Page)**, type:IGNORE

Step 2: Neo4j Representation

We imported:

~10.000.000 Nodes

~100.000.000 Relations

3. Creation of a cluster

Step 3: Cluster Specifications

— — —

MASTER NODE	
CPU	2 x Intel Xeon X5550 quad-core (4 core fisici – 8 core virtuali) – 8 MB cache L2, 2.66 GHz (Turbo Boot 3.06 GHz) – TDP 95 W
RAM	32 GB DDR3 800 MHz ECC
System Storage	2 x HD SAS 140 GB 15k RPM in RAID 1 hardware
Data Storage	4 x HD SAS 500 GB 10k RPM in RAID 5 hardware
Network	2 x Gigabit Ethernet
Model year	2009

Step 3: Cluster Specifications

— — —

Worker Nodes	
CPU	1 x Intel Core i7-6770HQ quad-core (4 core fisici – 8 core virtuali) – 6 MB cache L3, 2.6 GHz (turbo boost 3.5 GHz) – TDP 45 W
RAM	32 GB DDR4 2133 MHz non-ECC
Storage	1 x SSD M.2 (SATA 6Gbps) 1 TB
Network	1 x Gigabit Ethernet
Model year	2016

Step 3: Cluster Specifications

— — —

Step 3: Cluster Specifications

— — —

Cloudera Distribution Including Apache Hadoop v 5.10.1

- Apache Hadoop 2 (YARN, HDFS, MapReduce v2)
- Apache Hive, Apache Pig, Apache Spark, Apache Parquet, ...
- Cloudera Manager

4. Installation of Neo4j in a Cluster

Step 4: Configuration

— — —

Following the guidelines in

<http://neo4j.com/docs/operations-manual/current/tutorial/highly-available-cluster//>

we installed Neo4j on 2 machines. Data replication is thus easily achievable

```
# Unique server id for this Neo4j instance
# can not be negative id and must be unique
ha.server_id = 1

# List of other known instances in this cluster
ha.initial_hosts = neo4j-01.local:5001,neo4j-02.local:5001
# Alternatively, use IP addresses:
#ha.initial_hosts = 192.168.0.20:5001,192.168.0.21:5001,192.168.0.22:5001

# HA - High Availability
# SINGLE - Single mode, default.
dbms.mode=HA

# HTTP Connector
dbms.connector.http.enabled=true
dbms.connector.http.listen_address=:7474
```

Step 4: Neo4j with DBpedia on Cluster

```

fbianchi@siti-rack:~/neo4j-enterprise-3.1.3/bin
fbianchi@siti-rack:~/neo4j-enterprise-3.1.3/bin 254x71
[fbianchi@siti-rack bin]$ ./cypher-shell
Connected to Neo4j 3.1.3 at bolt://localhost:7687.
Type :help for a list of available commands or :exit to exit the shell.
Note that Cypher queries must end with a semicolon.
neo4j> MATCH (n) RETURN n LIMIT 3;
n
(:Ontology {ontologyId: "11855053", dbpedia: "http://dbpedia.org/ontology/RugbyPlayer", label: "Ontology", title: "RugbyPlayer"})
(:Ontology {ontologyId: "11855084", dbpedia: "http://dbpedia.org/ontology/Brewery", label: "Ontology", title: "Brewery"})
(:Ontology {ontologyId: "11855115", dbpedia: "http://schema.org/Book", label: "Ontology", title: "Book"})
neo4j> MATCH (n) RETURN n LIMIT 10;
n
(:Ontology {ontologyId: "11855053", dbpedia: "http://dbpedia.org/ontology/RugbyPlayer", label: "Ontology", title: "RugbyPlayer"})
(:Ontology {ontologyId: "11855084", dbpedia: "http://dbpedia.org/ontology/Brewery", label: "Ontology", title: "Brewery"})
(:Ontology {ontologyId: "11855115", dbpedia: "http://schema.org/Book", label: "Ontology", title: "Book"})
(:Ontology {ontologyId: "11855146", dbpedia: "http://dbpedia.org/ontology/SportsTeamMember", label: "Ontology", title: "SportsTeamMember"})
(:Ontology {ontologyId: "11855177", dbpedia: "http://dbpedia.org/ontology/SoccerLeague", label: "Ontology", title: "SoccerLeague"})
(:Ontology {ontologyId: "11855208", dbpedia: "http://dbpedia.org/ontology/SquashPlayer", label: "Ontology", title: "SquashPlayer"})
(:Ontology {ontologyId: "11855239", dbpedia: "http://www.ontologydesignpatterns.org/ont/d0.owl#Activity", label: "Ontology", title: "Activity"})
(:Ontology {ontologyId: "11855270", dbpedia: "http://schema.org/Park", label: "Ontology", title: "Park"})
(:Ontology {ontologyId: "11855301", dbpedia: "http://dbpedia.org/ontology/ChemicalCompound", label: "Ontology", title: "ChemicalCompound"})
(:Ontology {ontologyId: "11855332", dbpedia: "http://dbpedia.org/ontology/Skyscraper", label: "Ontology", title: "Skyscraper"})
neo4j>

```

5. Performance Evaluation

Experimental Settings

— — —

We tested some queries on both [Neo4j](#) and [Virtuoso](#); we then computed the time needed to obtain results

Virtuoso is a database engine hybrid that allows to store RDF data, querying is possible using the SPARQL language.

Each query has been run [10 times and average the results](#)

We report the most [meaningful](#) results and insights

Server choice

— — —

We decided to test the performance on the Azure server we used for the preceding steps because:

1. Azure server is faster and is easily accessible
<http://hadoop-itis.northeurope.cloudapp.azure.com:7474/browser/>
2. Some queries on the cluster required more than 15 minutes

Comparison with Limit (average in seconds)

MATCH (n) RETURN(n)
LIMIT K

SELECT ?entity WHERE {
?entity ?a ?b } LIMIT K

Query Performance

Triples in which the entity Barack Obama is subject

```
MATCH (n:Page { dbpedia: 'http://dbpedia.org/resource/Barack_Obama' })-[r]->(k) RETURN n, r, k  
LIMIT 100
```

average: 2.63 seconds **standard deviation:** 0.08 seconds

maximum: 2.81 seconds **minimum:** 2.55 seconds

```
SELECT ?a, ?b WHERE { <http://dbpedia.org/resource/Barack_Obama> ?a ?b } LIMIT 100
```

average: 0.11 seconds **standard deviation:** 0.002 seconds

maximum: 0.12 seconds **minimum:** 0.10 seconds

Better

Query Performance

— — —

Number of triples in which the entity Barack Obama is subject

```
MATCH (n:Page { dbpedia: 'http://dbpedia.org/resource/Barack_Obama' })-[r]->(k) RETURN  
(count(r))
```

average: 10.56 seconds **standard deviation:** 1.62 seconds

maximum: 15.14 seconds **minimum:** 9.81 seconds

```
SELECT count(?a) WHERE { <http://dbpedia.org/resource/Barack_Obama> ?a ?b }
```

average: 0.14 seconds **standard deviation:** 0.04 seconds

maximum: 0.24 seconds **minimum:** 0.11 seconds

Better

Schema in Neo4j

— — —

We realized that id indexing is not *suitable* for query that make heavy use of strings/pattern matching

We thus tested (rewrote) the queries using the *hardcoded* ids of the entities

Query Performance using IDs

- 1) Triples in which the entity Barack Obama is subject
- 2) Number of triples in which the entity Barack Obama is subject

`MATCH (n:Page)-[r]->(k)WHERE ID(n) = 3483224 RETURN n, r, k LIMIT 100`

average: 0.15 seconds **standard deviation:** 0.02 seconds

maximum: 0.22 seconds **minimum:** 0.13 seconds

`MATCH (n:Page)-[r]->(k) WHERE ID(n) = 3483224 RETURN (count(r))`

average: 0.09 seconds **standard deviation:** 0.09 seconds

maximum: 0.36 seconds **minimum:** 0.05 seconds

Neo4j average Before: 2.63 seconds
Virtuoso Average: 0.11 seconds

Neo4j average Before: 10.56 seconds
Virtuoso Average: 0.15 seconds

Paths in Neo4j

— — —

Paths between Barack Obama and Michelle Obama with 2 hop

```
MATCH p=(p1:Page {dbpedia:'http://dbpedia.org/resource/Barack_Obama'})-[*..2]-(p3:Page {dbpedia:'http://dbpedia.org/resource/Michelle_Obama'}) RETURN p
```

average: 87.78 seconds **standard deviation:** 23.74 seconds

maximum: 153.83 seconds **minimum:** 73.76 seconds

Paths in Neo4j using IDs

— — —

Paths between Barack Obama and Michelle Obama with 2 hops

```
MATCH p=(p1:Page)-[*..2]-(p3:Page)
```

```
WHERE ID(p3) = 3483224 AND ID(p1) = 1023097
```

```
RETURN p
```

average: 22.47 seconds **standard deviation:** 7.83 seconds

maximum: 41.05 seconds **minimum:** 16.85 seconds

Average Before: 87.78

Schema in Neo4j

— — —

We can use INDEX to optimize the retrieval.

```
CREATE INDEX ON :Page(dbpedia)
```

This comes at the cost of additional storage space and slower writes, so deciding what to index and what not to index is an important and often non-trivial task

<http://neo4j.com/docs/developer-manual/current/cypher/schema/index/>

Example of improvement using an index

— — —

Number of triples in which the entity Barack Obama is subject

```
MATCH (n:Page { dbpedia: 'http://dbpedia.org/resource/Barack_Obama' })-[r]->(k)
RETURN (count(r))
```

average: 0.05 seconds **standard deviation:** 0.004 seconds

maximum: 0.06 seconds **minimum:** 0.046 seconds

Neo4j average Before (using Ids): 0.15 seconds
Virtuoso Average: 0.09 seconds

Considerations on performance

— — —

Schema representation and Indexing in Neo4j are **fundamental** to obtain good performance

The index in Neo4j should be the **URI of the resource**, the use of integer IDs should be avoided

Querying using IDs and the Index on Neo4j has performance similar to the ones obtained with Virtuoso

Neo4j required a bit of configuration while importing data in Virtuoso was an out-of-the-box operation.

Thank you

Query da inserire

```
MATCH (n:Page)-[r]->(k)WHERE ID(n) = 3483224 RETURN n, r, k LIMIT 1
```
